

CABLE LOCK QUICK START GUIDE

Keep Your Visual Cables From Coming Unplugged

1. Fit the cable tie base around the cable and tighten it so that it is snug. Push up the tie base to the connector as close as possible.

2. Attach the cable tie to the device with a locking screw.

The cable lock system is made from two parts. The cable tie base that is placed around the connecting cable and a cable tie that is screwed onto the device.

3. Feed the cable tie through the base and plug the connector to the device.

The cable tie slides into the cable tie base while the connector is being plugged into the device. After the tie has been pulled the cable is locked to the device, helping to avoid loose cables.

4. Pull snugly on the tie so there is no slack to keep the connector from coming unplugged.
